

## 2 A, high efficiency single inductor buck-boost DC-DC converter

Datasheet - production data

### Features

- Input voltage range from 1.8 V to 5.5 V
- 2 A output current at 3.3 V in buck mode ( $V_{IN} = 3.6 \text{ V to } 5.5 \text{ V}$ )
- 800 mA output current at 3.3 V in boost mode ( $V_{IN} = 2.0 \text{ V}$ )
- Typical efficiency higher than 94%
- $\pm 2\%$  DC feedback voltage tolerance
- Automatic transition between step-down and boost mode
- Adjustable output voltage from 1.2 V to 5.5 V
- Power save mode (PS) at light load
- 2.0 MHz fixed switching frequency
- Adjustable switching frequency up to 2.4 MHz (by external synchronous square signal)
- Device quiescent current less than 50  $\mu\text{A}$
- Load disconnect during shutdown
- Shutdown function and soft-start
- Shutdown current < 1  $\mu\text{A}$
- Available in Flip Chip 20, pitch = 0.4 mm

### Applications

- Single cell Li-Ion, two-cell and three-cell alkaline, Ni-MH powered devices
- Memory card supply
- Tablet, smartphones
- Digital cameras

### Description

The STBB3J is a fixed frequency, high efficiency, buck-boost DC-DC converter which provides output voltages from 1.2 V to 5.5 V starting from input voltage from 1.8 V to 5.5 V. The device can operate with input voltages higher than, equal to, or lower than the output voltage making the product suitable for cell lithium-Ion applications where the output voltage is within the battery voltage range. The low- $R_{DS(on)}$  N-channel and P-channel MOSFET switches are integrated and contribute to achieve high efficiency. The MODE pin allows the selection between auto mode and forced PWM mode, taking advantage from either lower power consumption or best dynamic performance. The device also includes soft-start control, thermal shutdown, and current limit. The STBB3J is packaged in Flip Chip 20 bumps with 2.5 x 1.75 mm.

### 3 Pin configuration

Figure 3. Pin connection top view

AM16823v1

Figure 4. Pin connection bottom view

AM16824v1

Table 3. Pin description

Pin name	Pin	Description
VOUT	A1, A2, A3	Output voltage.
SW1	D1, D2, D3	Switch pin - internal switches are connected to this pin. Connect inductor between SW1 to SW2.
PGND	C1, C2, C3	Power ground.
SW2	B1, B2, B3	Switch pin - internal switches are connected to this pin. Connect inductor between SW1 and SW2.
EN	E4	Enable pin. Connect this pin to GND or a voltage lower than 0.4 V to shut down the IC. A voltage higher than 1.2 V is required to enable the IC.
MODE/SYNC	D4	When in normal operation, the MODE pin selects between auto transition mode and fixed frequency PWM mode. If the MODE pin is low, the STBB3J automatically switches between pulse-skipping and standard fixed frequency PWM according to the load level. If the MODE pin is pulled high, the STBB3J works always at fixed frequency. When a square wave is applied, this pin provides the clock signal for oscillator synchronization.
VIN_A	C4	Supply voltage for control stage. Connecting an R-C filter between VIN_A and GND.
VIN_SW	E1, E2, E3	Power input voltage.
GND	B4	Signal ground.
FB	A4	Feedback voltage.

## 4 Absolute maximum ratings

**Table 4. Absolute maximum ratings**

Symbol	Parameter	Value	Unit
VIN_A, VIN_SW	Supply voltage	-0.3 to 7.0	V
SW1,SW2	Switching nodes	-0.3 to 7.0	V
VOUT	Output voltage	-0.3 to 7.0	V
MODE, EN	Logic pins	-0.3 to 7.0	V
FB	Feedback pin for adjustable version	-0.3 to 1.5	V
ESD	Human body model	± 2000	V
T <sub>AMB</sub>	Operating ambient temperature	-40 to 85	°C
T <sub>J</sub>	Maximum operating junction temperature	150	°C
T <sub>STG</sub>	Storage temperature	-65 to 150	°C

*Note:* Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied.

**Table 5. Thermal data**

Symbol	Parameter	Value	Unit
R <sub>th(JA)</sub>	Thermal resistance junction-ambient	84	°C/W

## 5 Electrical characteristics

$V_{IN} = V_{INA} = V_{EN} = 3.6\text{ V}$ ,  $V_{OUT} = 3.3\text{ V}$ ,  $C_{IN} = 4 \times 10\text{ }\mu\text{F}$ ,  $C_{OUT} = 4 \times 10\text{ }\mu\text{F}$ ,  $R_{INA} = 47\text{ }\Omega$ ,  $C_{INA} = 100\text{ nF}$ ,  $L = 1.5\text{ }\mu\text{H}$ ,  $T_A = -40\text{ }^\circ\text{C}$  to  $85\text{ }^\circ\text{C}$  (unless otherwise specified; typical values are referred to  $T_A = 25\text{ }^\circ\text{C}$ ).

## 7 General description

The STBB3J is a high efficiency dual mode buck-boost switch mode converter. Thanks to the 4 internal switches, 2 P-channels and 2 N-channels, it is able to deliver a well-regulated output voltage using a variable input voltage which can be higher than, equal to, or lower than the desired output voltage. This solves most of the power supply problems that circuit designers face when dealing with battery-powered equipment.

The controller uses a peak current mode technique in order to obtain good stability in all possible conditions of input voltage, output voltage and output current. In addition, the peak inductor current is monitored to avoid saturation of the coil.

The STBB3J can work in two different modes: PWM mode or power save mode. Top-class line and load transients are achieved thanks to a feed-forward technique and due to the innovative control method specifically designed to optimize the performances in the buck-boost region where input voltage is very close to the output voltage.

The STBB3J is self-protected from short-circuit and overtemperature. Undervoltage lockout and soft-start guarantee proper operation during startup.

Input voltage and ground connections are split into power and signal pins. This allows reduction of internal disturbances when the 4 internal switches are working. The switch bridge is connected between the  $V_{IN}$  and PGND pins while all logic blocks are connected between  $V_{INA}$  and GND.

### 7.1 Dual mode operation

The STBB3J works in PWM mode or in power save mode (PS) according to the different status of the MODE pin. If the MODE pin is pulled high the device works in PWM only. In this case the device operates at 2 MHz fixed frequency pulse width modulation (PWM mode) in all line/load conditions. In this condition, the STBB3J provides the best dynamic performance. If the MODE pin is pulled low, at low average current the STBB3J enters PS mode allowing very low power consumption and therefore obtaining very good efficiency event at light load. When the average current increases, the device automatically switches to PWM mode in order to deliver the power needed by the load. In PS mode the STBB3J implements a burst mode operation: if the output voltage increases above its nominal value the device stops switching; as soon the  $V_{OUT}$  falls below the nominal value the device restarts switching with a programmed average current higher than the one needed by the load. [Figure 25](#) shows PS mode operation areas vs. output current in typical application conditions.

Figure 25. Auto mode vs. output current

## 7.2 External synchronization

The STBB3J implements the external synchronization function. If an external clock signal is applied to the MODE/SYN pin with a frequency between 1.6 MHz and 2.4 MHz and with proper low/high levels, the device automatically is in PWM mode and the external clock is used as switching oscillator.

## 7.3 Enable pin

The device turns on when the EN pin is pulled high. If the EN pin is low the device stops switching and all the internal blocks are turned off. In this condition the current drawn from  $V_{IN}/V_{INA}$  is below 1  $\mu A$  in the whole temperature range. In addition the internal switches are in off-state so the load is electrically disconnected from the input; this avoids unwanted current leakage from the input to the load.

## 7.4 Protection features

The STBB3J implements different types of protection features

### 7.4.1 Soft-start and short-circuit

After the EN pin is pulled high, or after a suitable voltage is applied to  $V_{IN}$ ,  $V_{INA}$  and EN, the device initiates the startup phase. The average current limit is gradually increased while the output voltage increases. As soon as the output voltage reaches 1.0 V, the average current limit is set to its nominal value.

### 7.4.2 Undervoltage lockout

The undervoltage lockout function prevents improper operation of the STBB3J when the input voltage is not high enough. When the input voltage is below the UVLO threshold, the device is in shutdown mode. The hysteresis of 100 mV prevents unstable operation when the input voltage is close to the UVLO threshold.

### 7.4.3 Overtemperature protection

An internal temperature sensor continuously monitors the IC junction temperature. If the IC temperature exceeds 160 °C (typ.), the device stops operating. As soon as the temperature falls below 140 °C (typ.), normal operation is restored.

## 8 Application information

### 8.1 Programming the output voltage

The external resistor divider must be connected between  $V_{OUT}$  and GND and the middle point of the divider must be connected to FB.

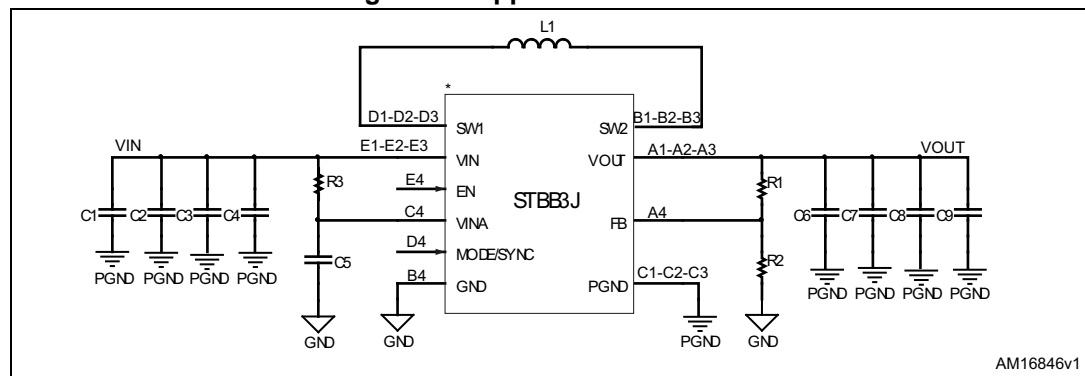

The value for the resistor R2, placed between FB and GND, should be chosen in order to set the divider current at 1  $\mu$ A. The recommended value for this resistor is in the range of 500 k $\Omega$  but to reduce the power consumption a maximum value of 200 k $\Omega$  can be used.

The value of the resistor R1, connected between  $V_{OUT}$  and FB, is function of the output voltage and can be calculated using the equation 1:

**Equation 1**

$$R1 = R2 \times \left( \frac{V_{OUT}}{V_{FB}} - 1 \right)$$

**Figure 26. Application schematic**

### 8.2 Inductor selection

The inductor is the key passive component for switching converters. With a buck-boost device, the inductor selection must take into consideration the following two conditions in which the converter works:

- as buck region at the maximum input voltage
- as boost region at the minimum input voltage

Two critical inductance values are then obtained according to the following formulas:

**Equation 2**

$$L_{\text{MIN\_BUCK}} = \frac{V_{\text{OUT}} \times (V_{\text{IN\_MAX}} - V_{\text{OUT}})}{V_{\text{IN\_MAX}} \times f_s \times \Delta I_L}$$

**Equation 3**

$$L_{\text{MIN\_BOOST}} = \frac{V_{\text{IN\_MIN}} \times (V_{\text{OUT}} - V_{\text{IN\_MIN}})}{V_{\text{OUT}} \times f_s \times \Delta I_L}$$

where  $f_s$  is the minimum value of the switching frequency and  $\Delta I_L$  is the inductor ripple current. The amplitude of the inductor ripple current is typically set between 20% and 40% of the maximum inductor current. To guarantee an inductor ripple current always lower than the selected value  $\Delta I_L$ , the higher value between  $L_{\text{MIN\_BUCK}}$  and  $L_{\text{MIN\_BOOST}}$  have to be chosen.

In addition to the inductance value, also the maximum current which the inductor can handle must be calculated in order to avoid saturation.

**Equation 4**

$$I_{\text{PEAK\_BUCK}} = \frac{I_{\text{OUT}}}{\eta} + \frac{V_{\text{OUT}} \times (V_{\text{IN\_MAX}} - V_{\text{OUT}})}{2 \times V_{\text{IN\_MAX}} \times f_s \times L}$$

**Equation 5**

$$I_{\text{PEAK\_BOOST}} = \left( \frac{V_{\text{OUT}} \times I_{\text{OUT}}}{\eta \times V_{\text{IN\_MIN}}} \right) + \frac{V_{\text{IN\_MIN}} \times (V_{\text{OUT}} - V_{\text{IN\_MIN}})}{2 \times V_{\text{OUT}} \times f_s \times L}$$

where  $\eta$  is the estimated efficiency. The maximum of the two values above must be considered when selecting the inductor.

## 8.3 Input and output capacitor selection

It is recommended to use ceramic capacitors with low ESR as input and output capacitors in order to filter any disturbance present in the input line and to obtain stable operation.

Minimum values of 10  $\mu\text{F}$  for both capacitors,  $C_{\text{IN}}$  and  $C_{\text{OUT}}$ , are needed to achieve good behavior of the device. The input capacitor must be placed as close as possible to the device.

An R-C filter is added to VINA pin (R3-C5 [Figure 26](#)) to assure a clean input voltage to the internal logic block.

## 9 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK is an ST trademark.

**Figure 30. Flip Chip 20 (2.5 x 1.75 mm) outline**

Table 8. Flip Chip 20 (2.5 x 1.75 mm) mechanical data

Dim.	mm		
	Min.	Typ.	Max.
A	0.50	0.55	0.60
A1	0.17	0.20	0.23
A2	0.33	0.35	0.37
b	0.21	0.25	0.29
D	2.485	2.515	2.545
D1		1.6	
E	1.731	1.761	1.791
E1		1.2	
e		0.40	
fD	0.447	0.457	0.467
fE	0.27	0.28	0.29
SE		0.20	
ccc		0.075	

**Note:** The terminal A1 on the bump side is identified by a distinguishing feature (for instance by a circular “clear area” typically 0.1 mm diameter) and/or a missing bump.

The terminal A1 on the backside of the product is identified by a distinguishing feature (for instance by a circular “clear area” less than 0.5 mm diameter).

## 10 Revision history

Rev 6

**Table 9. Document revision history**

Date	Revision	Changes
26-Sep-2013	1	Initial release.
25-Jun-2014	2	Document status promoted from preliminary to production data.
25-Nov-2014	3	Removed footnote from P-channel and N-channel on-resistance parameter in Table 6.
28-Jan-2015	4	Updated $I_{SWL}$ max.value in Table 6.
10-Dec-2015	5	Updated <i>Figure 1</i> and <i>Figure 26</i> .
11-Dec-2020	6	Updated <i>Figure 1</i> and <i>Table 2</i> .
