

TLE9350SJ

High speed CAN FD transceiver

RoHS

Features

- Fully compliant to ISO 11898-2:2016 and SAE J2284-4/-5
- Loop delay symmetry for CAN FD data frames up to 5 MBit/s
- Certified according to VeLIO (Vehicle LAN Interoperability and Optimization) test requirements
- Very low electromagnetic emission (EME) allows the use without additional common mode choke
- Excellent ESD robustness
- TxD time-out function
- Very low CAN bus leakage current in power-down state
- Overtemperature protection
- Protected against automotive transients according to ISO 7637 and SAE J2962-2
- Receive-only mode and power-save mode
- Green Product (RoHS compliant)

Potential applications

- Engine control units (ECU)
- Electric power steering
- Transmission control units (TCUs)
- Chassis control modules

Product validation

Qualified for automotive applications. Product validation according to AEC-Q100.

Description

The TLE9350SJ is a high speed CAN transceiver, used in HS CAN systems for automotive applications as well as for industrial applications. It is designed to fulfill the requirements of ISO 11898-2:2016 physical layer specification as well as SAE J1939 and SAE J2284.

The TLE9350SJ is available in a RoHS compliant, halogen free PG-DSO-8 package.

As an interface between the physical bus layer and the HS CAN protocol controller, the TLE9350SJ is designed to protect the microcontroller against interferences generated inside the network. A very high ESD robustness and the optimized RF immunity allows the use in automotive applications without additional protection devices, such as suppressor diodes or common mode chokes.

Based on the high symmetry of the CANH and CANL output signals, the TLE9350SJ provides a very low level of electromagnetic emission (EME) within a wide frequency range. The TLE9350SJ fulfills even stringent EMC test limits without an additional external circuit, such as a common mode choke.

The optimized transmitter symmetry combined with the optimized delay symmetry of the receiver enables the TLE9350SJ to support CAN FD data frames. The device supports data transmission rates up to 5 MBit/s, depending on the size of the network and the inherent parasitic effects.

Fail-safe features, such as overtemperature protection, output current limitation or the TxD time-out feature are designed to protect the TLE9350SJ and the external circuitry from irreparable damage.

| ESD immunity all other pins | V _{ESD_CDM_OP} | -500 | – | 500 | V | CDM ³⁾ | P_7.1.12 |

1) Not subject to production test, specified by design.

2) ESD susceptibility, Human Body Model (HBM) according to ANSI/ESDA/JEDEC JS-001.

3) ESD susceptibility, Charge Device Model (CDM) according to ANSI/ESDA/JEDEC JS-002.

Note: Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as outside normal-operating range. Protection functions are not designed for continuous repetitive operation.

3.2 Functional range

Table 3 Functional range

| Parameter | Symbol | Values | | | Unit | Note or Test Condition | Number |
|----------------------------|-----------------|--------|------|------|------|------------------------|---------|
| | | Min. | Typ. | Max. | | | |
| Supply voltages | | | | | | | |
| Transmitter supply voltage | V _{CC} | 4.75 | – | 5.25 | V | – | P_7.2.1 |
| Thermal parameters | | | | | | | |
| Junction temperature | T _J | -40 | – | 150 | °C | 1) | P_7.2.3 |

1) Not subject to production test, specified by design.

Note: Within the functional range the IC operates as described in the circuit description. The electrical characteristics are specified within the conditions given in the related electrical characteristics table.

3.3 Thermal resistance

Note: This thermal data was generated in accordance with JEDEC JESD51 standards. For more information, please visit www.jedec.org.

Table 4 Thermal resistance¹⁾

| Parameter | Symbol | Values | | | Unit | Note or Test Condition | Number |
|---|------------------|--------|------|------|------|--|---------|
| | | Min. | Typ. | Max. | | | |
| Thermal resistance | | | | | | | |
| Junction to ambient PG-DSO-8 | R_{thJA_DSO8} | – | 120 | – | K/W | 2) | P_7.3.2 |
| Thermal shutdown (junction temperature) | | | | | | | |
| Thermal shutdown temperature, rising | T_{JSD} | 170 | 180 | 190 | °C | temperature falling: minimum 150°C | P_7.3.3 |
| Thermal shutdown hysteresis | ΔT | 5 | 10 | 20 | K | | P_7.3.4 |

1) Not subject to production test, specified by design

2) Specified R_{thJA} value is according to JEDEC JESD51-2,-7 at natural convection on FR4 2s2p board. The product was simulated on a $76.2 \times 114.3 \times 1.5 \text{ mm}^3$ board with two inner copper layers ($2 \times 70\mu\text{m Cu}$, $2 \times 35\mu\text{m Cu}$).

4 High speed CAN functional description

HS CAN is a serial bus system that connects microcontrollers, sensors and actuators for real-time control applications. ISO 11898 describes the use of the Controller Area Network (CAN) within road vehicles. According to the 7-layer OSI reference model the physical layer of a HS CAN bus system specifies the data transmission from one CAN node to all other CAN nodes available within the network. The physical layer specification of a CAN bus system includes all electrical specifications of a CAN. The CAN transceiver is part of the physical layer specification.

4.1 High speed CAN physical layer

Figure 3 High speed CAN bus signals and logic signals

The TLE9350SJ operates as an interface between the CAN controller and the physical bus medium. A HS CAN is a two wire differential network which allows data transmission rates up to 5 MBit/s. The characteristics for a HS CAN are the two signal states on the CAN bus: dominant and recessive (see [Figure 3](#)).

The CANH and CANL pins are the interface to the CAN bus and both pins operate as an input and output simultaneously. The RxD and TxD pins are the interface to the microcontroller. The pin TxD is the serial data input from the CAN controller, the RxD pin is the serial data output to the CAN controller. As shown in [Figure 1](#), the TLE9350SJ includes a receiver and a transmitter unit, allowing the transceiver to send data to the bus medium and monitor the data from the bus medium at the same time. The TLE9350SJ converts the serial data stream which is available on the transmit data input TxD, into a differential output signal on the CAN bus, provided by the CANH and CANL pins. The receiver stage of the TLE9350SJ monitors the data on the CAN bus and converts them to a serial, single-ended signal on the RxD output pin. A "low" signal on the TxD pin creates a dominant signal on the CAN bus, followed by a logical "low" signal on the RxD pin (see [Figure 3](#)). The feature of broadcasting data to the CAN bus and listening to the data traffic on the CAN bus simultaneously is essential to support the bit-to-bit arbitration within CAN.

ISO 11898-2:2016 specifies the voltage levels for HS CAN transceivers. Whether a data bit is dominant or recessive depends on the voltage difference between the CANH and CANL pins ($V_{\text{Diff}} = V_{\text{CANH}} - V_{\text{CANL}}$).

To transmit a dominant signal to the CAN bus the amplitude of the differential signal V_{Diff} is higher than or equal to 1.5 V. To receive a recessive signal from the CAN bus the amplitude of the differential V_{Diff} is lower than or equal to 0.5 V.

In partially-supplied high speed CAN the bus nodes of one common network have different power supply conditions. Some nodes are connected to the power supply, while other nodes are disconnected from the power supply and in power-down state. Regardless of whether the CAN bus subscriber is supplied or not, each subscriber connected to the common bus media must not interfere with the communication. The TLE9350SJ is designed to support partially-supplied networks. In power-down state, the receiver input resistors are switched off and the transceiver input has a high resistance.

For permanently supplied ECUs, the HS CAN transceiver TLE9350SJ provides a power-save mode. In power-save mode, the power consumption of the TLE9350SJ is optimized to a minimum

The voltage level on the digital input TxD and the digital output RxD is determined by the power supply level at the V_{CC} pin. Depending on the voltage level at the V_{CC} pin, the signal levels on the logic pins (STB, TxD and RxD) are compatible with microcontrollers having a 5 V I/O supply.

5 Modes of operation

The TLE9350SJ supports the following modes of operation):

- Normal-operating mode
- Power-save mode
- Receive-only mode

The mode selection input pin NEN and NRM triggers mode changes. An undervoltage event on the supply V_{CC} powers down the device.

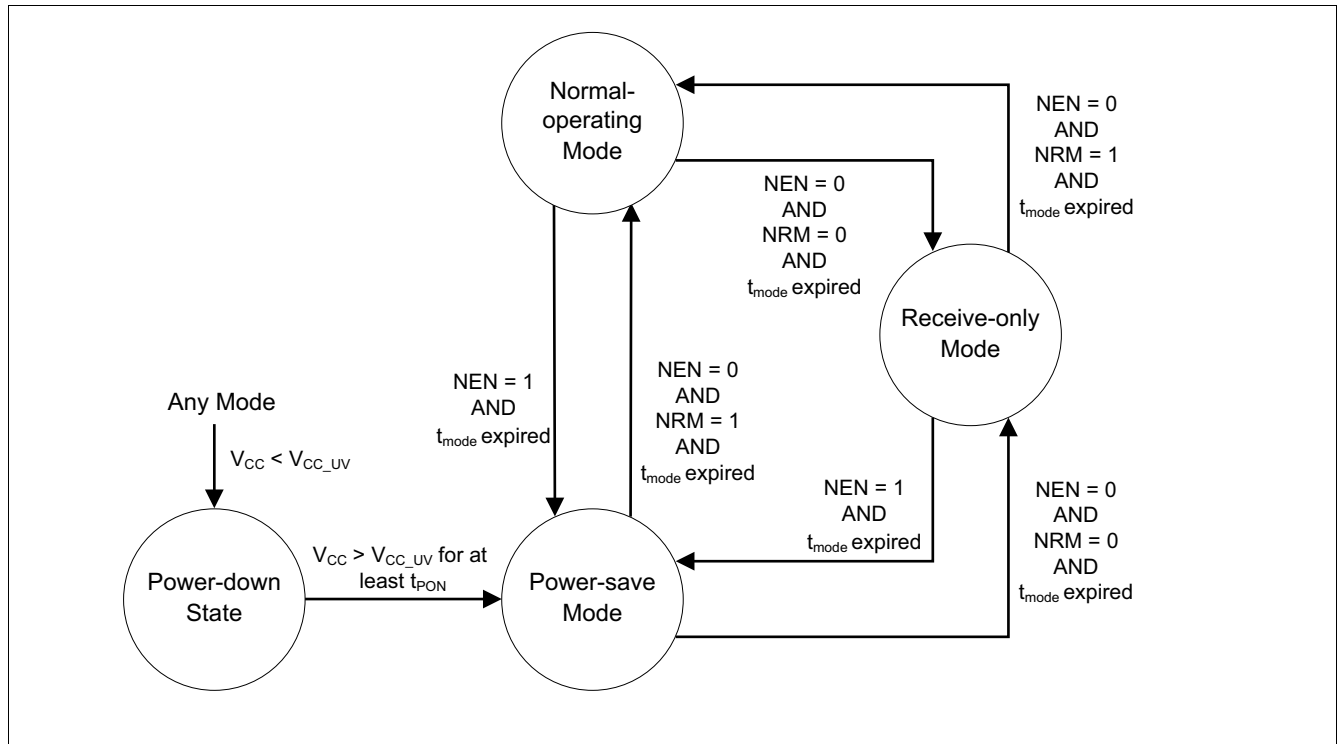

Figure 4 Mode state diagram

5.1 Normal-operating mode

In normal-operating mode all functions of the device are available and the device is fully functional. Data can be received from the HS CAN bus as well as transmitted to the HS CAN bus.

- The transmitter is enabled and drives the serial data stream on the TxD input pin to the bus pins CANH and CANL.
- The receiver is enabled and converts the signal from the bus to a serial data stream on the RxD output pin.
- The bus biasing is active.
- The TxD time-out function is enabled (see [Chapter 6.4](#)).
- The overtemperature protection is enabled (see [Chapter 6.6](#)).
- The undervoltage detection on V_{CC} is enabled (see [Chapter 6.3](#)).

The device enters normal-operating mode by setting the mode selection pins NEN to "low" and NRM to "high", see [Figure 4](#). Normal-operating mode can be entered if the device supply V_{CC} is higher than V_{CC_UV} . The device enters normal-operating mode after t_{mode} expires.

Note: If the device recognizes a recessive signal on the TxD input pin during a mode change from any mode to normal-operating mode, then it enables the transmit path after the mode change.

If the device recognizes a dominant signal on the TxD input pin during a mode change to normal-operating mode, then it keeps the transmit path disabled and it blocks the dominant signal in order to not disturb the bus communication. As soon as the device recognizes a recessive signal on the TxD input pin, it enables the transmit path again.

5.2 Receive-only mode

In receive-only mode the transmitter is disabled and the receiver is enabled. The TLE9350SJ can receive data from the HS CAN bus, but cannot transmit data to the HS CAN bus.

- The transmitter is disabled and the data available on the TxD input is blocked.
- The receiver is enabled and converts the signal from the bus to a serial data stream on the RxD output pin.
- The bus biasing is connected to $V_{CC}/2$ for $V_{CC} > V_{CC_UV}$.
- The TxD time-out function is disabled.
- The undervoltage detection on V_{CC} is enabled (see [Chapter 6.3](#)).

If the mode selection pin NRM is set to "low" while NEN is set to "low", then the TLE9350SJ enters receive-only. V_{CC} must be higher than V_{CC_UV} as a prerequisite to enter receive-only mode. The device enters receive-only mode after t_{mode} expires.

5.3 Power-save mode

In power-save mode the transmitter and receiver are disabled. (see also [Figure 4](#)):

- The transmitter is disabled and the data available on the TxD input is blocked.
- The receiver is disabled and the data available on the bus is blocked.
- The RxD output pin is permanently set to logical "high".
- The bus biasing is connected to high impedance.
- The NEN and NRM input pins are active and change the mode of operation to normal-operating mode or receive-only mode.
- The overtemperature protection is disabled.
- The undervoltage detection on V_{CC} is enabled.

Power-save mode can be entered from normal-operating mode or receive-only mode by setting the NEN pin to logical "high". The device enters this mode after t_{mode} expires or after the period of t_{PON} when coming from power-down state.

5.4 Power-down State

If the supply voltage $V_{CC} < V_{CC_UV}$, then the device powers down independently of Independent of NRM and NEN input pins (see [Figure 5](#)). In power-down state all functions of the device are disabled and the device is switched off. The input resistors of the receiver are disconnected. The CANH and CANL bus interface of the device is floating and acts as a high impedance input with a very low leakage current. The high impedance input does not influence the recessive level of the CAN and allows an optimized EME performance of the entire network. In power-down state the transceiver is an invisible node to the bus. t_{pon} must expire as a prerequisite for the device to exit power-down state.

- The transmitter and receiver are disabled.
- The bus biasing is connected to high impedance.
- The TxD time-out function is disabled.
- The overtemperature protection is disabled.
- The undervoltage detection on V_{CC} is enabled.

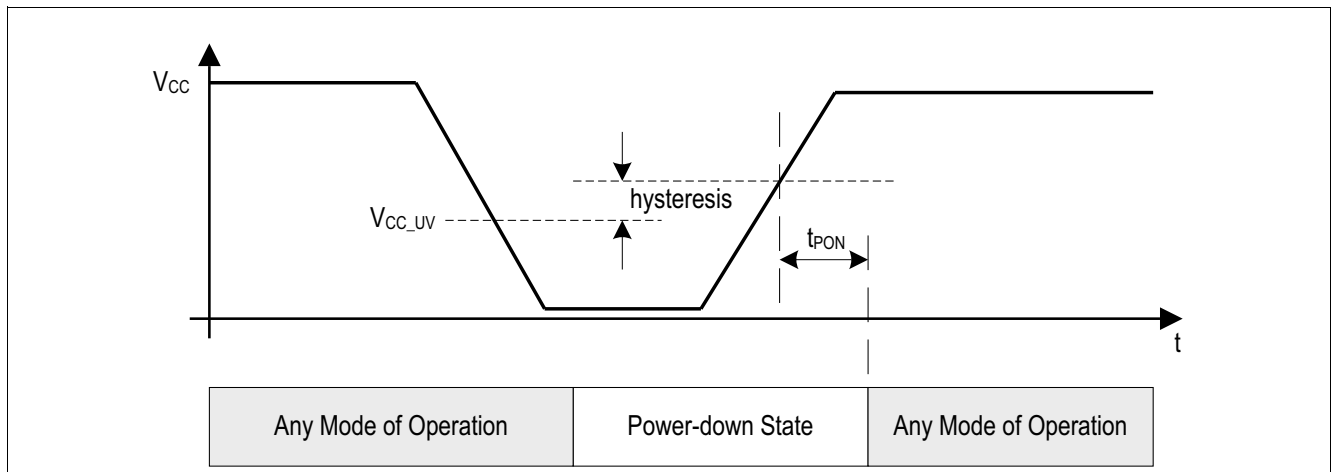

Figure 5 Power-down and power-up behavior and V_{CC}

6 Fail safe functions

6.1 Short circuit protection

The CANH and CANL bus outputs are short circuit proof to GND and short circuit proof to a supply voltage. The current limiting circuit is designed to protect the transceiver from damage. If the device heats up due to a continuous short on the CANH or CANL, then the internal overtemperature protection switches off the bus transmitter.

6.2 Unconnected logic pins

All logic input pins have an internal pull-up resistor to V_{CC} . If the V_{CC} supply is active and the logical pins are open, the device enters the power-save mode by default.

6.3 V_{CC} undervoltage

If the transceiver supply is in undervoltage condition $V_{CC} < V_{CC_UV}$, then the device switches to power down mode (see [Figure 5](#)).

6.4 TxD time-out feature

The TxD time-out feature protects the CAN bus against permanent blocking in case the logical signal on the TxD pin is continuously "low". A continuous "low" signal on the TxD pin might have its root cause in a locked-up microcontroller or in a short circuit on the printed circuit board, for example.

In normal-operating mode, a "low" signal on the TxD pin for the time $t > t_{TxD}$ enables the TxD time-out feature and the device disables the transmitter (see [Figure 6](#)). The receiver is still active and the device continues to monitor data on the bus via the RxD output pin.

Figure 6 TxD time-out function

Figure 6 shows how the transmitter is deactivated and activated again. A permanent "low" signal on the TxD input pin activates the TxD time-out and deactivates the transmitter. To release the transmitter after a TxD time-out event, the device requires a signal change on the TxD input pin from "low" to "high".

6.5 Delay time for mode change

The device changes the mode of operation within the time window t_{Mode} . During the mode change from power-save mode to non-low power mode the device sets the RxD output "high" permanently, so it does not reflect the status on the CANH and CANL input pins.

After the mode change is completed, the device releases the RxD output pin.

6.6 Overtemperature protection

The TLE9350SJ has an integrated overtemperature detection, which is designed to protect the device against thermal overstress of the transmitter. The overtemperature protection is only active in normal-operating mode. In case of an overtemperature condition, the temperature sensor disables the transmitter while the transceiver remains in normal-operating mode. After the device cools down it enables the transmitter again (see [Figure 7](#)). A hysteresis is implemented within the temperature sensor.

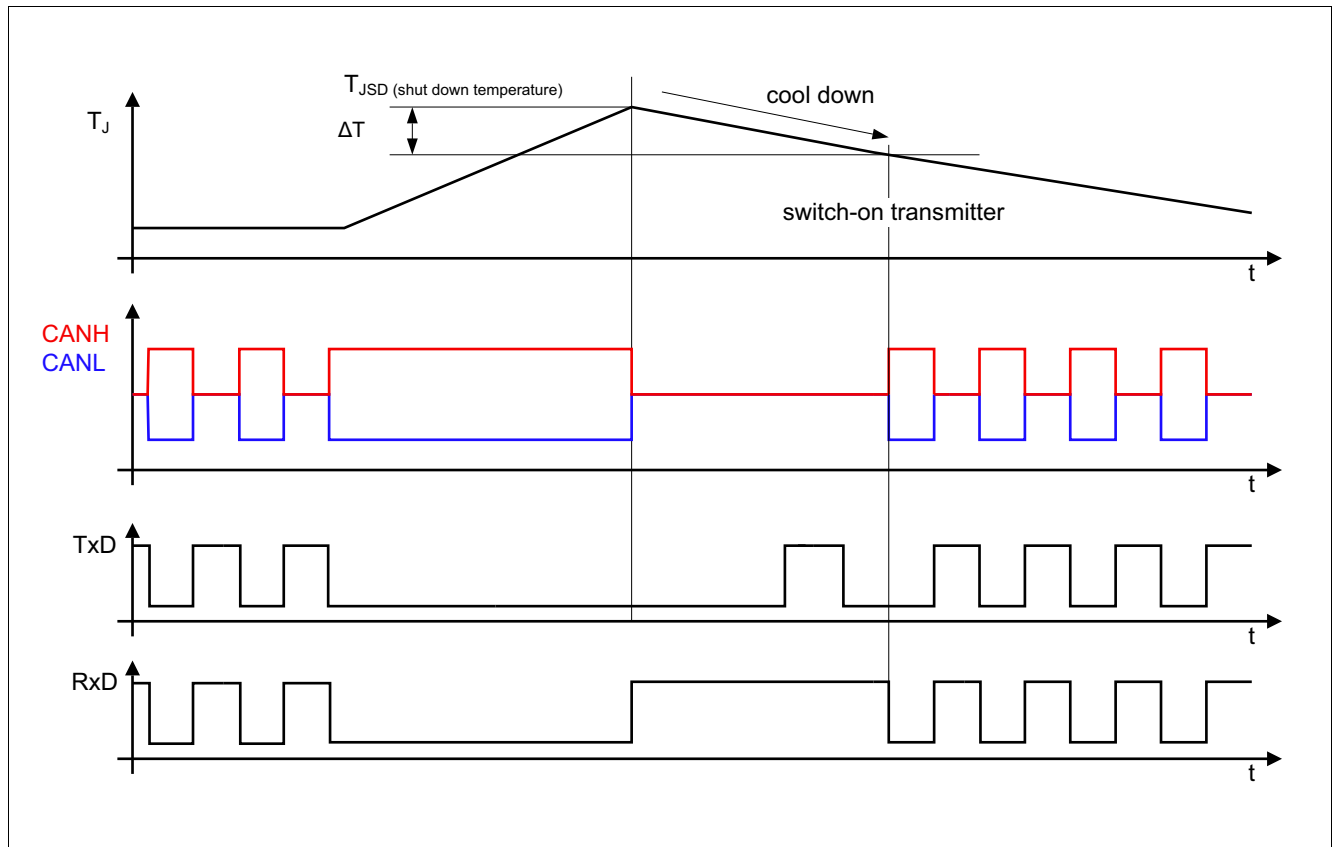

Figure 7 Overtemperature protection

| Parameter | Symbol | Values | | | Unit | Note or Test Condition | Number |
|---|---|---------------------|---------------------|---------------------|---------------|---|----------|
| | | Min. | Typ. | Max. | | | |
| CANL, CANH recessive output voltage normal-operating mode | $V_{CANL,H}$ | 2.0 | 2.5 | 3.0 | V | $V_{TxD} = V_{CC}$; no load | P_8.4.1 |
| CANH, CANL recessive output voltage difference normal-operating mode | $V_{Diff_R_NM} = V_{CANH} - V_{CANL}$ | -500 | -10 | 50 | mV | $V_{TxD} = V_{CC}$; no load | P_8.4.2 |
| CANL dominant output voltage normal-operating mode | V_{CANL} | 0.5 | 1.5 | 2.25 | V | $V_{TxD} = 0 \text{ V}$; $50 \Omega < R_L < 65 \Omega$ | P_8.4.3 |
| CANH dominant output voltage normal-operating mode | V_{CANH} | 2.75 | 3.4 | 4.5 | V | $V_{TxD} = 0 \text{ V}$; $50 \Omega < R_L < 65 \Omega$ | P_8.4.4 |
| Differential voltage dominant normal-operating mode $V_{Diff} = V_{CANH} - V_{CANL}$ | $V_{Diff_D_NM}$ | 1.5 | 1.9 | 2.5 | V | $V_{TxD} = 0 \text{ V}$; $50 \Omega < R_L < 65 \Omega$ | P_8.4.5 |
| Differential voltage dominant extended bus load normal-operating mode | $V_{Diff_EXT_BL}$ | 1.4 | 1.9 | 3.3 | V | $V_{TxD} = 0 \text{ V}$; $45 \Omega < R_L < 70 \Omega$ | P_8.4.6 |
| Differential voltage dominant high extended bus load normal-operating mode | $V_{Diff_HEXT_BL}$ | 1.5 | 3.5 | 5.0 | V | ¹⁾ $V_{TxD} = 0 \text{ V}$; $R_L = 2240 \Omega$; static behavior | P_8.4.7 |
| Driver symmetry ($V_{SYM} = V_{CANH} + V_{CANL}$) | V_{SYM} | $0.9 \times V_{CC}$ | $1.0 \times V_{CC}$ | $1.1 \times V_{CC}$ | V | ^{1) 2)} $C_1 = 4.7 \text{ nF}$ | P_8.4.10 |
| CANL short circuit current | I_{CANLsc} | -115 | 90 | 115 | mA | ¹⁾ $-3 \text{ V} < V_{CANLshort} < 18 \text{ V}$; $t < t_{TxD}$; $V_{TxD} = 0 \text{ V}$ | P_8.4.11 |
| CANH short circuit current | I_{CANHsc} | -115 | -90 | 115 | mA | ¹⁾ $-3 < V_{CANHshort} < 18 \text{ V}$; $t < t_{TxD}$; $V_{TxD} = 0 \text{ V}$ | P_8.4.13 |
| Leakage current, CANH | $I_{CANH,lk}$ | -5 | 1 | 5 | μA | $V_{CC} = 0 \text{ V}$; $0 \text{ V} < V_{CANH} \leq 5 \text{ V}$; $V_{CANH} = V_{CANL}$ | P_8.4.19 |
| Leakage current, CANL | $I_{CANL,lk}$ | -5 | 1 | 5 | μA | $V_{CC} = 0 \text{ V}$; $0 \text{ V} < V_{CANL} \leq 5 \text{ V}$; $V_{CANH} = V_{CANL}$ | P_8.4.20 |

Table 9 Electrical characteristics transmitter (Continued)

4.75 V < V_{CC} < 5.25 V; $R_L = 60 \Omega$; $-40^\circ\text{C} < T_j < 150^\circ\text{C}$; all voltages with respect to ground; positive current flowing into pin; unless otherwise specified.

| Parameter | Symbol | Values | | | Unit | Note or Test Condition | Number |
|---|------------------------------|--------|------|------|------------------|--|----------|
| | | Min. | Typ. | Max. | | | |
| CANH, CANL output voltage difference slope, recessive to dominant | $V_{\text{diff_slope_rd}}$ | – | 42 | 70 | V/ μs | ¹⁾ 30% to 70% of measured differential bus voltage, $C_2 = 100 \text{ pF}$, $R_L = 60 \Omega$, 4.75 V < V_{CC} < 5.25 V | P_8.4.21 |
| CANH, CANL output voltage difference slope, dominant to recessive | $V_{\text{diff_slope_dr}}$ | – | 42 | 70 | V/ μs | ¹⁾ 70% to 30% of measured differential bus voltage, $C_2 = 100 \text{ pF}$, $R_L = 60 \Omega$, 4.75 V < V_{CC} < 5.25 V | P_8.4.22 |

1) Not subject to production test, specified by design.

2) V_{SYM} is observed during dominant and recessive state and also during the transition from dominant to recessive state and vice versa, while TxD is stimulated by a square wave signal with a frequency of 1 MHz.

7.5 Electrical characteristics dynamic transceiver parameters

Table 10 Electrical characteristics dynamic transceiver parameters

4.75 V < V_{CC} < 5.25 V; $R_L = 60 \Omega$; $-40^\circ\text{C} < T_j < 150^\circ\text{C}$; all voltages with respect to ground; positive current flowing into pin; unless otherwise specified.

| Parameter | Symbol | Values | | | Unit | Note or Test Condition | Number |
|--|-------------------------|--------|------|------|------|--|---------|
| | | Min. | Typ. | Max. | | | |
| Propagation delay TxD-to-RxD | t_{Loop} | 80 | 150 | 255 | ns | $C_1 = 0 \text{ pF}$, $C_2 = 100 \text{ pF}$, $C_{\text{RxD}} = 15 \text{ pF}$; (see Figure 9) | P_8.5.1 |
| Propagation delay increased load TxD-to-RxD | $t_{\text{Loop}_{150}}$ | 80 | 180 | 330 | ns | $C_1 = 0 \text{ pF}$, $C_2 = 100 \text{ pF}$, $C_{\text{RxD}} = 15 \text{ pF}$, $R_L = 150 \Omega$ ¹⁾ | P_8.5.2 |
| Propagation delay TxD to bus "low" to dominant | $t_{\text{d(L)_T}}$ | 30 | 70 | 140 | ns | $C_1 = 0 \text{ pF}$, $C_2 = 100 \text{ pF}$, $C_{\text{RxD}} = 15 \text{ pF}$; (see Figure 9) | P_8.5.3 |
| Propagation delay TxD to bus "high" to recessive | $t_{\text{d(H)_T}}$ | 30 | 90 | 140 | ns | $C_1 = 0 \text{ pF}$, $C_2 = 100 \text{ pF}$, $C_{\text{RxD}} = 15 \text{ pF}$; (see Figure 9) | P_8.5.4 |
| Propagation delay bus to RxD dominant to "low" | $t_{\text{d(L)_R}}$ | 30 | 90 | 140 | ns | $C_{\text{RxD}} = 15 \text{ pF}$, Independent of t_{Bit} ; (see Figure 9) | P_8.5.5 |
| Propagation delay bus to RxD recessive to "high" | $t_{\text{d(H)_R}}$ | 30 | 100 | 140 | ns | $C_{\text{RxD}} = 15 \text{ pF}$, Independent of t_{Bit} ; (see Figure 9) | P_8.5.6 |

Delay Times

| | | | | | | | |
|----------------------------|-------------------|---|----|----|---------------|---------------|---------|
| Delay time for mode change | t_{Mode} | – | 12 | 20 | μs | ¹⁾ | P_8.5.7 |
|----------------------------|-------------------|---|----|----|---------------|---------------|---------|

CAN FD characteristics

| | | | | | | | |
|--|--------------------------|-----|-----|-----|----|--|----------|
| Received recessive bit width at 2 MBit/s | $t_{\text{Bit(RxD)_2M}}$ | 420 | 450 | 520 | ns | $C_2 = 100 \text{ pF}$; $C_{\text{RxD}} = 15 \text{ pF}$; $t_{\text{Bit}} = 500 \text{ ns}$; see Figure 10 | P_8.5.13 |
| Received recessive bit width at 5 MBit/s | $t_{\text{Bit(RxD)_5M}}$ | 120 | 150 | 220 | ns | $C_2 = 100 \text{ pF}$; $C_{\text{RxD}} = 15 \text{ pF}$; $t_{\text{Bit}} = 200 \text{ ns}$; see Figure 10 | P_8.5.14 |
| Transmitted recessive bit width at 2 MBit/s | $t_{\text{Bit(Bus)_2M}}$ | 455 | 470 | 510 | ns | $C_2 = 100 \text{ pF}$; $C_{\text{RxD}} = 15 \text{ pF}$; $t_{\text{Bit}} = 500 \text{ ns}$; see Figure 10 | P_8.5.15 |

Table 10 Electrical characteristics dynamic transceiver parameters (Continued)

4.75 V < V_{CC} < 5.25 V; $R_L = 60 \Omega$; $-40^\circ\text{C} < T_j < 150^\circ\text{C}$; all voltages with respect to ground; positive current flowing into pin; unless otherwise specified.

| Parameter | Symbol | Values | | | Unit | Note or Test Condition | Number |
|---|----------------------------------|--------|------|------|------|--|----------|
| | | Min. | Typ. | Max. | | | |
| Transmitted recessive bit width at 5 MBit/s | $t_{\text{Bit(Bus)}_5\text{M}}$ | 155 | 170 | 210 | ns | $C_2 = 100 \text{ pF}$; $C_{\text{RxD}} = 15 \text{ pF}$; $t_{\text{Bit}} = 200 \text{ ns}$; see Figure 10 | P_8.5.16 |
| Receiver timing symmetry at 2 MBit/s $\Delta t_{\text{Rec_2M}} = t_{\text{Bit(RxD)}_2\text{M}} - t_{\text{Bit(Bus)}_2\text{M}}$ | $\Delta t_{\text{Rec_2M}}$ | -45 | -23 | 15 | ns | $C_2 = 100 \text{ pF}$; $C_{\text{RxD}} = 15 \text{ pF}$; $t_{\text{Bit}} = 500 \text{ ns}$; see Figure 10 | P_8.5.17 |
| Receiver timing symmetry at 5 MBit/s $\Delta t_{\text{Rec_5M}} = t_{\text{Bit(RxD)}_5\text{M}} - t_{\text{Bit(Bus)}_5\text{M}}$ | $\Delta t_{\text{Rec_5M}}$ | -45 | -23 | 15 | ns | $C_2 = 100 \text{ pF}$; $C_{\text{RxD}} = 15 \text{ pF}$; $t_{\text{Bit}} = 200 \text{ ns}$; see Figure 10 | P_8.5.18 |

1) Not subject to production test, specified by design.

Figure 9 Timing diagrams for dynamic characteristics

Figure 10 Recessive bit time for five dominant bits followed by one recessive bit

8 Application information

8.1 ESD robustness according to IEC 61000-4-2

Tests for ESD robustness according to IEC 61000-4-2 Gun test (150 pF, 330 Ω) have been performed. The results and test conditions are available in a separate test report.

Table 11 ESD robustness according to IEC 61000-4-2

| Performed test | Result | Unit | Remarks |
|---|-----------|------|------------------------------|
| Electrostatic discharge voltage at pin CANH and CANL versus GND | $\geq +8$ | kV | ¹⁾ positive pulse |
| Electrostatic discharge voltage at pin CANH and CANL versus GND | ≤ -8 | kV | ¹⁾ negative pulse |

1) Not subject to production test. ESD susceptibility "ESD GUN" according to GIFT/ICT paper: "EMC Evaluation of CAN Transceivers, version IEC TS62228", section 4.3. (DIN EN61000-4-2)
Tested by external test facility (IBEE Zwickau).

8.2 Application example

9 Package information

Figure 12 PG-DSO-8

Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e. Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).
